No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 6, A

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Replication protein A (RPA) is involved in a novel method for detecting immunostimulatory DNA. The method involves combining a sample of DNA with RPA and detecting complex formation. This method can be used to identify agonists and antagonists of immunostimulatory DNA. Agonists or identify antagonists may be used as vaccine adjuvants and for, immunotherapy for cancer, allergic diseases, inflammatory diseases and inflammatory autoimmune diseases (eg. systemic lupus erythematosus, arthritis, psoriasis, ginglivitis, sarcoidosis, multiple sclerosis, colitis and ileitis). The present sequence is the immunostimulatory oligonucleotide AAC-22. This was used in the development of the novel method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel vaccine formulation comprising a respiratory syncytial virus (RSV) antigen and an immunostimulatory CpG oligonucleotide. The CpG motifs of the immunostimulatory oligonucleotide are unmethylated, and the backbone of the oligonucleotide is preferably all-phosphorothicate. The RSV antigen used may be F (fusion) protein, G attachment) protein, an FG fusion protein, an immunogenic derivative of any of these proteins, or inactivated RSV. RSV causes lower respiratory tract illness in humans, particularly in children and the elderly. The RSV vaccine of the invention is used for preventing or ameliorating RSV infection in a patient. The present sequence represents an immunostimulatory CpG oligonucleotide which may be used in the RSV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel vaccine formulation comprising a respiratory syncytial virus (RSV) antigen and an immunostimulatory CpG oligonucleotide useful for treating RSV infections mutations.
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunostimulatory CpG oligonucleotide WD0003 used in an RSV vaccine.
                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an HIV vaccine comprising an HIV antigen and an immunostimulatory Oligonucleotide (AAF59501-AAF5960). With the exception of oligonucleotide WD1005 (AAF59505), the immunostimulatory oligonucleotide wD1005 (AAF59505), the immunostimulatory professed contain at least one unmethylated CpG motif. In preferred embodiments the internucleotide linkage is phosphorodithicate, although phosphodisater and other internucleotide bonds, or mixtures of linkages are within the scope of the invention. The HIV antigen may be selected from gpl60, gpl20, Nef. Tat, and Nef or Tat derivatives or fusion proteins. The vaccine is used for the prophylaxis or treatment of HIV infection in a patient. The present sequence represents a specifically claimed immunostimulatory CpG oligonucleotide for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New vaccine formulation comprising human immunodeficiency virus (HIV) antigen and immunostimulatory CpG oligonucleotide, useful for preventing and treating HIV infections in a patient.
                                                                                                                                                                                                                                                                                       Immunostimulatory CpG oligonucleotide WD1003 for use in an HIV vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  arthritis, myasthenia gravis, systemic lupus erythematosis, chronic inflammation, atherosclerosis, inflammatory bowel disease, reactive arthritis, chronic infections, graft rejection, gingivitis, gastritis, ulcer, thrombosis, allergy and acute infections. AAH43895 to AAH43899 and AAB99542 to AAB99673 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein hsp60, which are capable of acting as antagonists of hsp60 characterised by their ability to reduce or prevent the induction of a pro-inflammatory immune response of cells of the innate immune system by hsp60. The peptides have antiinflammatory, antidiabetic, antirheumatic, immunosuppressive, noctropic, antiarteriosclerotic, antimicrobial, antiulcer, antiallergic and neuroprotective activities. The antagonists are useful in the treatment of an inflammatory disease or disorder, e.g. an autoimmune disease, diabetes, multiple sclerosis, rheumatoid

This invention relates to a novel method for inducing maturation of an interferon producing cell to a dendritic cell and inducing interferon alpha) production by the interferon producing cell upon viral stimulation. The method comprises contacting the interferon producing cell with a CpG nucleic acid. The method of the invention may have cell with a CpG nucleic acid. The method of the invention may have is useful for modulating the physiology of certain defined subsets of dendritic cells, as well as for regulating the production of various is useful for modulating the physiology of certain defined subsets of centriferons by subsets of dendritic cells. Specifically, the methods of the invention are useful for inducing IFN alpha production, IL-12 production, and interferon producing cells are useful in cellular therapy for viral infections and diseases such as human immunodeficiency virus (HIV), hepatitis and tumours. The present sequence represents an objection to the method of the invention cellular in cellular incontinual cellular cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method of treating cancer and comprises the administration of an effective amount of a tumour-desirved dendritic cell (DC) inhibitory antagonist in combination with an effective amount of Toll-like receptor (TLR) agonist to an individual in need of
                Inducing maturation of an interferon producing cell (IPC) to a dendritic cell or inducing interferon alpha production, for e.g. therapy of tumors, comprises contacting the IPC with a CpG nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                        This single-stranded oligonucleotide is one example of an immunostimulatory sequence containing a palindrome. The sequence is very similar to the sequence of the first 30 nucleotides of an immunostimulatory 45mer (see AAQ20698) but has a different palindromic sequence. It has a strong activity to augment the activity of mouse NK

The invention relates to a novel non-human model animal unresponsive to an immunopotentiating synthetic compound, characterised by lacking a gene function that encodes TLR7 which recognises an immunopotentiating synthetic compound. a polynuclectide of the invention has virucide activity, and is useful as a TRL agonist and TRL antagonist. The model animals are useful in studying the mechanism of action of imidazoquinoline compounds, and in screening remedies particularly synthetic compounds for viral infections. The present sequence is used in
treatment. The method has cytostatic activity through the activation of dendritic cells that are rendered hypo-responsive to activation stimuli by the disease. The method is useful for treating cancers such as melanoma, breast, pancreas, colon, ung, glioma, hepatocellular, endometrium, gastric, intestinal, renal, prostate, thyroid, ovarian, esticular, liver, head and neck, colorectal, oesophagus, stomach, eye, bladder, glioblastoma and metastatic carcinomas. The present sequence is that of CpG motif-containing unmethylated oligonucleotide AAC-30 of the invention, an agonist of Toll-like receptor (TLR) 9 and which is active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Non-human model animals unresponsive to an immunopotentiating synthetic compound e.g. of imidazoquinoline type lacking TLR7-encoded gene function, useful in screening drugs.

The immunomodulatory polynucleotides can be used for ameliorating a symptom of an infectious disease and IgE-related disorder. The IMP, s may also be used for the treatment of a disorder associated with a T helper (TH)2-type immune response (e.g. allergies, allergy-induced asthma or acopic dermatitis), individuals receiving vaccines such as therapeutic vaccines (e.g. vaccines comprising an allergy epitope, a mycobacterial epitope or a tumour associated epitope) or prophylactic vaccines. The IMP's can also be used for the treatment of e.g. food allergies, rhinitis, atopic dermatitis, conjunctivitis, urticaria, shock,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel immunomodulatory polynucleotide (IMP) comprising a palindromic sequence. The palindromic sequence comprises at least 8 bases in length, which contains at least two dinucleotides (CG), and at least one trinucleotide (TCG) y tor near the 5' end of the polynucleotide. The CG dinucleotides are separated by 0 - 5 bases. The 5' T of the (TCG)y is positioned 0 - 3 bases from the 5' end of the polynucleotide. The (TCG)y is separated from the 5' end of the palindromic sequence by 0 - 2 bases. The palindromic sequence includes all or part of the (TCG)y sequence, where y = 1 or 2. The immunomodulatory polynucleotides have the following activities: antimicrobial,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunomodulatory polynucleotide useful for the treatment of e.g. atopic dermatitis comprises palindromic sequence comprising at least eight base in length, which contains at least two dinucleotides and at least one

Hymenoptera sting allergies and drug allergies and parasitic infections; viral disease e.g. Hepatitis B, Hepatitis C, influenza, Acquired immunodeficiency syndrome (AIDS) and Herpes zoster; and cancer; inflammatory disorder e.g. ulcerative colitis; fibrotic disorder e.g. didopathic pulmonary fibrosis, scleroderma, cutaneous radiation-induced fibrosis, hepatic fibrosis including schietosomiasis-induced hepatic fibrosis. The IMP's may also be used to create a prophylactic vaccine to increase resistance to infection by bacterial or prophylactic vaccine to increase resistance to interferon almmune viral pathogens. The immunomodulatory polynucleotide modulates an immune cimulates cytokines including type I interferons e.g. IRN-alpha and IRN-comega and IRN-gamma, production from human cells; effectively stimulates cytokines including type I interferons e.g. IRN-alpha and IRN-comega and IRN-comega and activates plasmacytoid dendritic cells to undergo maturation which can result in retardation of plasmacytoid dendritic cell apoptosis in culture. This polynucleotide sequence dendritic call apoptosis in culture. This polynucleotide sequence

The invention relates to a novel immunomodulatory polynucleotide (IMP)

Example 1; SEQ ID NO 92; 119pp; English.

```
comprising a palindromic sequence. The palindromic sequence comprises at least 8 bases in length, which contains at least two dinucleotides (CG), and at least one trinucleotide (TCG)y at or near the 5' end of the polynucleotide. The Cdinucleotides are separated by 0 - 5 bases. The 5' or of the CDC) in the (TCG)y is positioned 0 - 1 bases from the 5' end of the polynucleotide. The (TCG)y is separated from the 5' end of the polynucleotide. The (TCG)y sequence, where y= 1 or 2. The immunomodulatory polynucleotides have the following activities: antimicrobial, antimicropic, anti-HV, cycletatic, antiuleer, antiparasticic, virucide, hepatotropic, anti-HV, cycletatic, antiuleer, and nephrotropic. The immunomodulatory polynucleotides can be used for the treatment of a disorder associated with a T helper (TH) 2-type immune response (e.g. allergies, allergy explicit, antipic and also be used for the treatment of a disorder associated with a T helper (TH) 2-type immune response (e.g. allergies, allergy explicit, antipical, atopic dermattis), individuals receiving vaccines (e.g. vaccines of e.g. vaccines comprising an allergy explicit.

CC vaccines The IMP's and also be used for the treatment of e.g. food allergies, thinitis, atopic dermattis, conjunctivitis, urticaria, shock, varial disease e.g. ulceraties, collumnicativitis, urticaria, shock, varial disease e.g. ulceratics of the treatment of e.g. food allergies, thinitis, atopic dermattis, conjunctivitis, urticaria, shock, impantic pulmonary tibrosis, soleroderma, cutaneous radiation-induced indopatic pulmonary tibrosis, soleroderma, cutaneous radiation-induced inflammatory disorder e.g. ulcerative collitis; fibrotic disorder e.g. ulceratics of consist end of the invention of plasmacytoid dendritic cell apoptosis including chipscomming e.g. IRP-tarbitis of consistence of include

The present invention provides one kind of high-copied and stable plasmid, which is prepared through combining oligonuclectide sequence ODN with immunostimulation to specific vector. The ODN inside the plasmid can stimulate immune cell without being modified with thiophosphate. The plasmid any be used as immune adjuvant and especially as adjuvant of therapeutic vaccine for treating hepatities and other chronic contagious diseases and tumors. The present sequence represents ODN plasmid related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                       plasmid, which is prepared through combining oligonucleotide sequence ODN with immunostimulation to specific vector. The ODN inside the plasmid can stimulate immune call without being modified with thiophosphate. The plasmid may be used as immune adjuvant and especially as adjuvant of therapeutic vaccine for treating hepatitis B and other chronic contagious diseases and tumors. The present sequence represents an ODN plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides one kind of high-copied and stable plasmid, which is prepared through combining oligonucleotide sequence ODN with immunostimulation to specific vector. The ODN inside the plasmid can stimulate immune call without being modified with thichobosphate. The plasmid may be used as immune adjuvant and especially as adjuvant of therapputic vaccine for treating hepatitis B and other chronic contagious related oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; vaccine; hepatitis B; infection; cancer; cytostatic neoplasm;

Replication protein A (RPA) is involved in a novel method for detecting immunostimulatory DNA. The method involves combining a sample of DNA with RPA and detecting complex formation. This method can be used to identify agonists and antagonists of immunostimulatory DNA. Agonists of immunotherapy for antagonists may be used as vaccine adjuvants and for, immunotherapy for autoimmune diseases, inflammatory diseases and inflammatory autoimmune diseases (eg. systemic lupus erychematosus, arthritis, psoriamis, ginglivitis, sarcoidosis, multiple sclerosis, colitis and ileitis). The present sequence is the immunostimulatory oligonucleotide ACC-22. This was used in the development of the novel method

/Gione Ilda Shot-Coar Protal and poly A+ RNA was lablated from the indicated stickleback tissue, and a CDNA library was constructed in the Express I plasmid vector by Open Biosystems. First strand cDNA synthesis was primed with an 54 bp linker primer containing an oligodr sequence preceeded by a synthetic NoI site (first strand primer: 5 - GACTAGTTCTAGATGGGAGGGGCGCCC(T) 25-3). Following second strand synthesis, cDNAs were made blunt at the end corresponding to the original 5 prime end of mRNA, and cloned directionally into the NoI and EcoRV sites of Express 1. Note that the EcoRV site is typically destroyed in the blunt end cloning, leaving a junction of the form 'xxxATC' (where is ATC is the second half of the EcoRV site, and xxx is derived from the cDNA sequence). A map of the Express I vector is available at: http://www.openbiosystems.com/cdna library construction fa thup://www.openbiosystems.com/cdna library construction fa in DH108 (TI phage resistant) bacteria. Clones available from Cypen Biosystems:
                                                                            SM Gaterosteus acuteatus

Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998, 2002).This clone is in a
modified pBluescript vector.
Please visit our web site (http://pfgweb.gsc.riken.jp and
http://rarge.gsc.riken.jp) for further details.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  387 bp mRNA linear EST 16-FEB-2005
BP835967 RAFL19 Arabidopsis thaliana cDNA clone RAFL22-70-F16 5',
mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Spermatophyta; Magnollophyta; eudicotyledons; core eudicotyledons; roside; eurosida II; Brassicales; Brassicaceae; Arabidopsis.

APPLICANT: Krieg, Arthur

ITILE OF INVERTION: Methods Related to Immunostimulatory

ITILE OF INVERTION: Nucleic Acid-Induced Interferon

FILE REFERENCE: C1039/7044

CURRENT APPLICATION NUMBER: 08/09/672,126B

CURRENT PILING DATE: 2000-09-27

PRIOR APPLICATION NUMBER: 60/166,147

PRIOR PLICE DATE: 1999-09-29

NUMBER OF SEQ ID NOS: 169

SOFTWARE: FRASERQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-672-126B-164

PRICENT NO. 5877273
GENERAL INFORMATION:
APPLICANT: Hance, Allan J
APPLICANT: Levy-Frebault, Veronique
APPLICANT: Levy-Frebault, Veronique
APPLICANT: Grandchamp-Desraux, Bernard
TITLE OF INVENTION: Applications to the synthesis or detection of nucleic
TITLE OF INVENTION: application as immunogenic compositions.
NUMBER OF SEQUENCES: 31
CORRESPENDENCE ADDRESS:
ADDRESSEE: Walter H. Dreger

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-08-105-168B-22

Sequence 22, Application US/08105168B

Sequence 22, Application US/08105168B

Patent No. 5589585

GENERAL INFORMATION:

APPLICANT: MABILAT et al.

TITLE OF INVENTION: DNA FRAGMENTS OF MYCOBACTERIA, AMPLIFICATION

TITLE OF INVENTION: MYCOBACTERIA

NUMBER OF SEQUENCES: 23

CORRESPONDENCE ADDRESS:

ADDRESSEE: Oliff & Berridge

STREET: 700 South Washington Street, Suite 300

CITY: Alexandia,

STATE: Virginia
                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                        Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
